

Case study for installing a dual site mirrored and load balanced GSM gateway solution on to a Cisco Call Manager across an MPLS network for a major UK Blue Chip organisation

A major blue chip organisation recently installed a 2N Stargate onto their Cisco Call Manager at two of their largest sites and then connected it to all other sites over their MPLS network. The projected savings are £250,000 annually and their UK fixed to mobile call costs have fallen to around 4ppm. This solution also offers options of free SMS from the desktop and calling international mobiles at the same rate as of that of UK mobiles.

This solution offers full redundancy, free failsafe lines and like all L2MC solutions is available without capital expenditure.
