

Fixed To Mobile Convergence

A unique FMC solution that can connect to any PBX and Mobile Phone, without the need to change Mobile Network.

L2MC FMC (Fixed Mobile Convergence) Helps Reduce Mobile Call Costs, Saves on Total Cost of Ownership And gives the user Seamless Communication

It is estimated that as many as 40% of calls from mobile are made whilst sitting at the desk. Pushing calls over your PBX in this instance can dramatically cut call costs. This works particularly well with calls to mobiles or international destinations.

Benefits of L2MC FMC

- **MAKING CALLS** - Outbound International and National calls to route over PSTN at cheaper rate.
- **LEAST COST ROUTING FROM THE MOBILE** - Default set-up will ensure all calls that are cheaper to route over PSTN will do so automatically.
- **LOCATION INDEPENDENT** - Default setting ensures outbound calls route over PSTN regardless of the geographical location of mobile. It will be as if you are sitting at your desk, whether you are in or out of the office.
- **MOBILE OFFICE** - From now on, customers trying to reach you on your fixed-line will be put through to your mobile phone; as incoming calls to your fixed line will be redirected to your mobile after a few rings. This feature known as twinning **turns your fixed-line into a mobile office** - meaning you will be reachable on either number! You won't miss a call; resulting in far fewer callbacks! And, you will even be able to transfer calls to colleagues in the office, if necessary. This flexibility can only lead to greater productivity!

- SINGLE NUMBER - Only one number need be given out and used on which you are always more likely to be available.
- FIELD STAFF - Field based staff need not be given desk-phone saving on hardware costs
- DECT REPLACEMENT - Mobile handsets can be used instead of DECT saving money on purchasing additional old technology
- NO PICO CELL REQUIREMENT - Unlike other FMC solutions, no PICO cell devices are required in your building
- NETWORK INDEPENDENT - Unlike other FMC solutions, this is network independent, so the mobile contract need not be changed.

Capital Equipment Savings

Our range of connectivity options are unique, vitally we can connect to any host PBX regardless of age e.g. if customers have an old PBX but want today's FMC solution without the cost of upgrading or changing their PBX then we can connect via analogue extension ports. Other methods of connection include BRI, PRI, SIP and H.323.

Reduced Cost of Ownership

Unlike other FMC solutions our units do not invoke the call to the mobile user via a line connected to the PABX, which in turn results in a landline to mobile call that is expensive and results in additional costs on your telephone bill. Our solution works simply by inserting the required amount of Sims as you need simultaneous calls into the FMC platform. These Sims could be part of your existing tariff for your company mobile phones which would then mean calls from your office staff to the FMC users and calls into your DDI number get routed via these Sims which in turn makes these calls *Free Of Charge!

The cost of ownership can be minimal in these circumstances and coupling this with the increased levels of customer service and productivity, means the FMC solution from L2MC is a product that your business should not ignore.

Functionality of your office extension, on your Mobile!

The FMC offering from L2MC, delivers all of the functionality of your desk phone on your mobile, with no compromise.

The FMC product suite is manufactured by the globally renowned manufacturer of GSM technology, 2N Telecommunications.

Seamless Communication

These days our expectations are high, whilst on the move, we demand e-mail, Internet and other services without any degradation of quality. The FMC product range from L2MC goes one step further to delivering on your expectations.

With L2MCs FMC solution calls to your office extension, both internally and externally, are automatically routed to your mobile phone. Both devices ring and whichever is answered first automatically stops the other one ringing. This means you never miss a call, can advertise one number to your customers and also for ease only need to manage one voicemail platform. We also give your mobile users all of the features of the Host PBX, e.g. hold, transfer, conference calling voicemail and many more.

Don't worry if you miss a call from the FMC unit, it will text you automatically the number of the person that was trying to reach you.

Symbian and Windows Mobile applications

With the full range of FMC solutions from L2MC, you have the option of using the enhanced client software for either Symbian or Windows Mobile handsets. This software is loaded directly onto your mobile phone and enables you to dial internal office extension numbers, and automatically route more expensive calls like 0800, 0870 and international calls back to the office and through your normal landlines to reduce ongoing call costs.

A state-of-the-art feature which helps you significantly reduce the cost of international calls when calling from your mobile

MAKING INTERNATIONAL CALLS - You are out of the office when you realise you have forgotten to call your business partner in Canada. You do not need to worry about how much the GSM operator is going to charge you for making a call to Canada. By simply dialing the number for 2N[®] Mobility Extension, you only pay for a cheap call within the local GSM network, which may even be free of charge, if you use a VPN SIM card. In other words, the call will be handled in the same way as if you were sitting at your desk in the office. All you have to do is dial your Mobility Extension number followed by the international call number.

Making calls in general

If you have a smart phone an app can be installed on the handset to automate the procedure of placing calls. In this instance all calls will route over the PSTN

regardless of whether you are in the field or office and without the need to dial in to the device.
