

## Reduce Roaming Charges with a GSM Gateway

Roaming charges represent a significant proportion of many mobile phone bills. It is not unusual for this to account for 40% of total mobile costs during the busy periods. Outbound roaming charges are far higher than inbound and can account for 80% of these overall costs.

The CallBack feature on our GSM gateway enables significant savings on calls made from your mobile phone while abroad. You only pay for an incoming call within the roaming mode, which is always substantially cheaper.

### How it works

Simply send an SMS message - containing the number you want to call - to the CallBack number (the GSM gateway number in the PBX).

CallBack automatically dials the requested number and your mobile number simultaneously, and connects the two calls.

You are only charged for the SMS message and incoming call based on a roaming tariff, which is always cheaper than an outgoing call.

### Similar in principle to SMS CallBack is CallBack following a call:

Dial the number for the PBX GSM gateway, let it ring once and hang up.

The unit will call you back and when you answer the incoming call, you will be offered the option of entering a number.

Dial the number of the person you want to call and NetStar will connect you.

You are only charged for an incoming roaming call which is always cheaper than an outgoing call.

For even more convenient use of the CallBack feature you can use software for mobile phones with Symbian operating system.
